Application: Software Engineer Intern - Summer 2027

Dear Sentry team,

I'm a fourth-year computer science engineering student at Polytech Marseille, applying for Sentry's Summer 2027 Software Engineer Internship. I'm available from May 2027. I enjoy backend work and care about how it shapes the product people use, which is what draws me to Sentry's developer tools.

While building SummitBase, a tool for trade-show organizers, I worked on email and reminder queues and tested how they behaved under retries and concurrent delivery. I liked working through those details because a seemingly simple reminder depends on getting them right. That work made me more interested in understanding failures and helping people diagnose them.

I use Sentry in every project I deploy to production, so the chance to help build a tool I already rely on is especially appealing. I also follow AI development closely, and I'm curious about how Seer uses debugging context to help engineers investigate problems. I'd love to contribute my TypeScript and backend experience while learning how your team builds tools developers can trust. Thank you for considering my application.

Best regards,
Omar Benjelloun
